

Filesys

Data = actual data in bits/bytes
Meta data

- name
- type
- location
- size
- creator
- time
- security

API

create()
link()
unlink()
open()
close()
read()
write()

Allocation techniques

Contiguous

- store contiguously on disk
- easy to implement
- best performance
- doesn't support file growth

linked

- stored as linked list
- header contains ptr to 1st & last file block
- Linked list of data block
- Linked list in FAT
- BAD Random access
- no hard links
- volume & file size is limited
- simple to implement

Direct allocation

- file headers points to each data block
- easy to implement
- no support for large files

Indexed allocation

- direct ptrs to index block
- direct ptrs to data
