

NFS/GFS

Issues

- Naming
- Performance
- Failure handling
- consistency

RPL

Consistency

- Coherence = restricts order of reads/writes to 1 location
- Consistency = restricts order of all

- consistency, restricts order of reads/write across multiple locations
- Staleness = max delays between writes/read to location

GFS

- Huge files
- stored on cluster of servers
- multiple chunk servers
- Fault tolerant
- Master is replicated
